**Project Guide**  
**Mr. Praveen Shinde**

# 1. Introduction

A Cafeteria Management System using Python and MySQL can be developed to manage orders, inventory, and customer interactions efficiently. Python handles the user interface, order processing, and inventory management, while MySQL stores and retrieves data such as menu items, prices, customer details, and order history.

- Problem Identified :

1. When multiple users place orders simultaneously, database inconsistencies can occur.
2. Users might enter invalid inputs, like negative quantities or non-numeric values when placing an order. This could lead to incorrect calculations or even system crashes

•Solution Proposed :

1. Implement **stock verification** before order confirmation to prevent overselling.
2. Implement **input validation** to check that:  
Quantity is a **positive integer**.  
Price is a **positive number**.  
Required fields are **not empty**.

## 2. Objectives

- 1.To facilitate cafe billing management by allowing users to input orders for various items, calculate totals, and display service charges and taxes.
- 2.Store Data: Save menu and order details in a database.
- 3.To automate bill generation and display
- 4.To maintain records of orders in database and saves bills

### 3. Scope

1. Can be applied in school cafeterias
2. Can be useful to cafeteria staff, restaurant owners and managers etc.
3. Can be expanded to support online orders and multiple cafeteria branches
4. Can generates bills and supports multiple payment methods.
5. Can be integrated with mobile apps for online ordering.
6. Can enhance security by restricting access to authorized users only.

## **4. Feature /Functionality**

1. QR Generation: To automate bill generation and display.
2. Menu Display: Displays the available menu items with prices using PrettyTable.
3. Order Management: Handles order placement by accepting the customer's choice of dishes and generates a bill.
4. Order History: Enables viewing customer order details

## **5. Outcome of Project**

1. User can place orders easily through an automated system.
2. User can view the menu with prices and availability.
3. User can save bills with accurate calculations, including taxes and discounts.
4. User can receive digital receipts for their orders.
5. User can update the menu by modifying items.

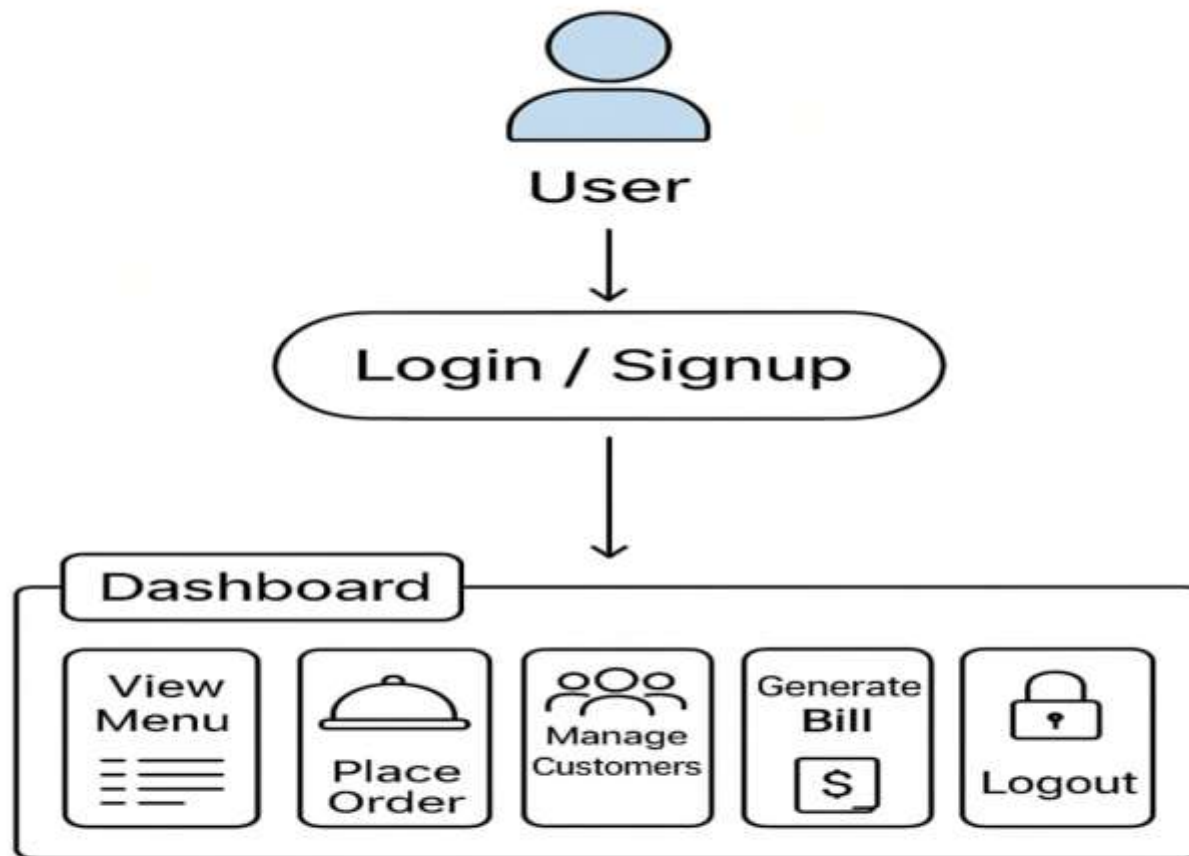

# 6. Technology Stack

Frontend: Python

Backend: MySQL
